# ProjectVue

## Bringing Projects into Focus

Trinity Technology Group (TrinityTG) offers a reusable Project Management Tool to manage the complexities of large-scale information technology projects. This tool, called ProjectVue, is built on the Microsoft Dynamics CRM 2016 platform, allowing it to be configurable, extendable, and maintainable to meet the needs of our clients.

ProjectVue consolidates all of the tools that project leads need to manage waterfall, agile, or hybrid implementations, and creates the reports and other information that guide their projects to success. It was developed to support – and be consistent with – the major industry standard project management methodologies and ISO standards from PMBOK and PMP.

## Our 4T Methodology

TrinityTG's guiding principles of project management are represented by our 4T project management methodology, which promotes project **Transparency**, **Traceability**, **Truthfulness** and **Transferability.** The 4T methodology provides project leads with the ability to continually review, monitor, and execute projects throughout the project life cycle. By doing so, ProjectVue:

- Provides transparency to project teams by showing progress on activities and tasks, including ongoing execution and implementation plans.  It also provides all stakeholders to the status and mitigation strategies for project issues and risks. Beyond the core project management features, ProjectVue also provides the entire project team – including business analysts, developers, and quality assurance analysts – access to, and tracking of, crucial project information, including Sources, Business processes, Requirements Management, Development Artifacts, Release Management, Document Repository, Test Script to Defect Tracking, and Change Control.
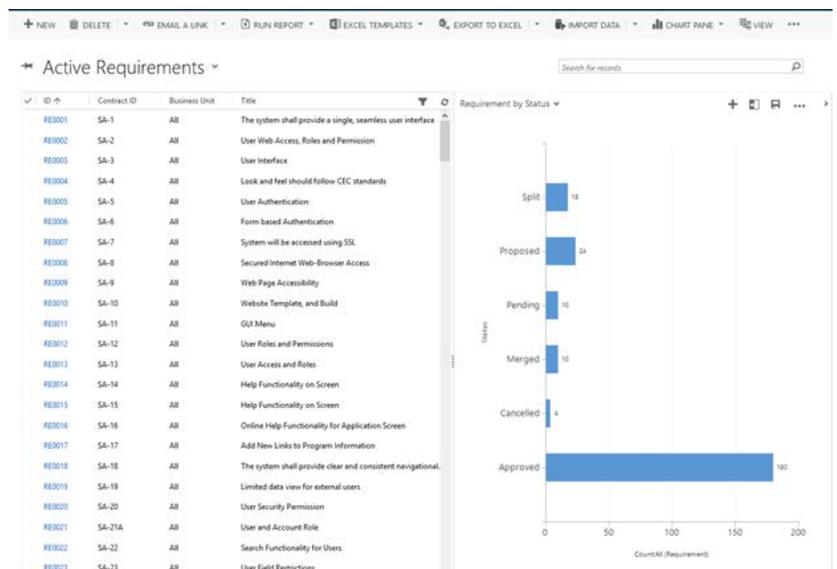

- **Documents, traces, and verifies** activities, assignments, and commitments by promoting full traceability from requirements, through use cases to test cases, and by providing links to the information that is crucial to the project life cycle.

- Provides a **single point of truth** that includes operational, analytical and executive dashboards and ad hoc reporting features that allow all stakeholders to assess vital information, key performance indicators, and documents in the repositories at any time, in real-time.

- Enables the client to **transfer** all ProjectVue solution components and project data from ProjectVue to their in-house data warehouse or reporting environment. This allows information to be consolidated for enterprise reporting. Similarly, external project management data can also be loaded into ProjectVue to provide consistent and robust enterprise reporting. Project partners value the information captured throughout the project; they understand that information captured throughout the project life cycle will persist for the entire lifetime of the project.

## ProjectVue is Proven

ProjectVue has proven itself to be an effective tool on multiple projects. With it, TrinityTG has achieved a 100% success rate of solution delivery, noteworthy client savings, and on-time delivery. ProjectVue demonstrates that greater visibility means even greater success.
