TrinityTG enables geolocation within Microsoft solutions

Two-way integration with map-based services within public sector solutions

October 29, 2026, Trinity Technology Group, Sacramento, CA - TrintyTG has been providing solutions to public-sector clients for over 25 years and the capabilities in technology are always evolving. Over a dozen years ago we were exploring GIS and how it could benefit our clients and developing solutions to overcome their challenges. Finding ways to build the integrations that allow true interoperability is something we strive to be known for. We would like to show you how this could truly impact your organization by demonstrating how having this integration could benefit the overall organization.

California for years has been improving upon it's services it provides to it's citizens making sure to provide a 'digital experience for all'. The one commonality with most organizations is that they serve or meet a particular need. When they implement IT solutions to support the organization they often contain similar components. The solution will most likely be available online and will have a portal. That portal can be accessed by internal organizational users and external public users. The solution determines the information available based on the role of said user. At times some organization's merely support public users with access to information with no login needed and then with login additional information may be available. Internal organizational users as well will have different levels of access to information and dashboards based upon their role.

Built with Agnostic Approach to be able to be used by all

TrinityTG has built numerous solutions for different public-sector clients and have successfully used tools like Microsoft Power Platform to build those solutions. A major component of many of these solutions is the ability to integrate or interface with other systems and databases to provide comprehensive and robust information back for both internal and external users. Whether your focus is in Health and Human Services or Natural Resources or Regulatory Operations the citizens you serve are looking to visualize how they can meet their needs no matter where they are in California.

Let us show you how we have done that

We have built a 30 minute webinar to showcase how we have:

- Developed a two-way integration with esri GIS and MS Power Platform
- That the same can be done with any mapping/geolocation service
- How it can enhance your IT solution for internal and external users
